FOR IMMEDIATE RELEASE

MEKITEC ANNOUNCES NEW PRODUCTS FOR FOOD X-RAY INSPECTION

Mekitec to Exhibit at FachPack, September 24-26, 2019.

Mekitec Group, a global manufacturer of innovative food quality control systems based on X-ray technology, will showcase their newest X-ray inspection system model, MEKI™ C at FachPack 2019. As an exhibitor, Mekitec will be able to connect with food industry professionals to share and further discuss about the latest trends of food safety and quality control.

Mekitec's newest system model **MEKI™ C** provides very smooth production flow and superior X-ray detection performance without the need for any protective lead curtains, since the radiation protection is ensured with special mechanical design. The system is especially suitable for products that might otherwise have difficulties with conventional X-ray systems with lead curtains, e.g. food products packaged in cups; noodles, yoghurts, and ready-to-eat meals.

In addition to showcasing the curtain-free MEKI™ C, Mekitec offers the visitors a possibility to bring their own food products for a free on-the-spot product application testing. The test shows food producers the detection performance that X-ray inspection has to offer for their food products regarding foreign object detection and quality control.

"Mekitec focuses on creating the best value for customers and solving industry-specific quality control needs, e.g. a missing sauce pouch inside a cup noodle packaging, we offer a perfect fit for food producers to implement better product inspection. FachPack 2019 is the perfect opportunity to showcase our quality control solutions and to have discussions with the food industry professionals," said Mr. Juho Ojuva, Director of Global Sales and Customer Care of Mekitec.

"X-ray technology has been around for quite some time, but only recently has it truly had a breakthrough and become accessible for use in all food industries, as the barriers for implementation are tackled. The importance of having comprehensive quality control in place and a Critical Control Point in each packaging line has increased. By choosing X-ray inspection, food manufacturers can detect even the non-metallic contaminants, such as glass, stone, dense plastics and other quality defects. We look forward to exhibiting our newest solutions for food manufacturers from all over the world and presenting the capabilities of X-ray quality control" Mr. Ojuva concludes.

ABOUT MEKITEC

Mekitec is a global manufacturer of X-ray systems for the food industry. The company is committed to ensure safe food by providing inspection systems with the best value in the industry.

MEKI™ X-ray systems are a part of the food production line guaranteeing the safety and quality by detecting and removing food products that contain unwanted foreign objects or other defects by using the latest X-ray imaging and processing technology, resulting in 100% food quality control.
